

Introduction to Statistics - Homework #4

Exercise 1

An employee at a call center takes between 0.5 and 6.5 minutes to respond to a phone call, and this response time is assumed to be uniformly distributed between 0.5 and 6.5. If the response times of 60 independent calls are observed, approximate the probability that the average response time is at least 4 minutes.

Exercise 2

When Team A and Team B play a game in a sport, probabilities that Team A wins or loses are 0.6 and 0.4, respectively. Each outcome gives 3 points for a win and 0 points for a loss. Let $X_1, X_2, \dots, X_n$ denote the points earned by Team A in n independent games (assume independence across games). Answer the following questions.

(1) Find the joint probability mass function of X_1 and X_2 .

(2) Let $\bar{X}_2$ be the average score over 2 games. Find the probability mass function of $\bar{X}_2$.

(3) Find the expectation $E[\bar{X}_2]$ and variance $Var(\bar{X}_2)$.

(4) Suppose the two teams play 54 games. Approximate the probability that Team A's average score is at least 2.

Exercise 3

The weight (in g) of a product follows $N(\mu, 3^2)$. Take a random sample of size $n = 16$ and let S^2 be the sample variance. Define

$$V = \frac{(n-1)S^2}{\sigma^2}.$$

Answer the following questions.

(1) Find the distribution of V .

(2) Find the probability $P(V < 25)$.
